Who uses Digital Dictation?

- Industry
- Local government
- Law Court
- Education
- Medical facilities
- ...in fact anywhere digital transcription is required.

included accessories

- Digital Dictation software
- Footpedal
- Headphones

Specifications are based on measurement conditions and proper care for the machine. Marantz reserves the right to change design and specification without notice.

Availability of models may vary by territory

Digital Dictation is a complete software/hardware package for Microsoft Windows™ that allows you to control the play back of digital audio files on your computer using the supplied Digital Dictation foot pedal and software.

DD1 is the perfect complement to the Marantz Professional PMD670 solid state recorder for any application which involves recording and transcription of spoken word. The Digital Dictation software allows digital files, such as those recorded with the PMD670, to be played back on a Microsoft Windows PC using the supplied foot pedal to control the transport in exactly the same way as a standard cassette transcription machine.

Because the pedal works in exactly the same way as traditional analogue solutions, it enables a new user to quickly switch to digital transcription using the same techniques they have always used, minimising the learning curve required.

For transcription and dictation users, the benefits of moving to digital are obvious:

- No more archiving piles of slowly decaying tapes, just transfer the audio file to a file server or burn to CDROM.
- If you need to distribute the audio, just email it or place it on a webservice.
- CD quality audio if required, or adjust the audio quality based on the amount of storage available (when using the Marantz Professional PMD670)

Users in many different industries are already experiencing the benefits of the Digital Dictation system in conjunction with the PMD670 recorder: in the medical industry, local government, law enforcement and education to name but a few.
